So at resonance: Voltage across inductor and capacitor cancels each other, so voltage across resistor  $V_r = V$ , supply voltage. Since net reactance is zero, circuit becomes purely resistive circuit and hence the voltage and the current are in same phase, so the phase angle between them is zero.

What is resonance in a series RLC circuit?

Resonance in Series RLC Circuit Definition: Resonance in a series RLC circuit is when the inductive reactance equals the capacitive reactance, causing maximum current flow. Inductive Reactance: Inductive reactance increases with frequency, behaving like an open circuit at high frequencies.

What is the difference between resonant frequency and circuit current?

In series RLC circuit current,  $I = V / Z$  but at resonance current  $I = V / R$ , therefore the current at resonant frequency is maximum as at resonance in impedance of circuit is resistance only and is minimum. The above graph

shows the plot between circuit current and frequency.

Why is a resonant frequency a short circuit?

LC Therefore at the resonant frequency the impedance seen by the source is purely resistive. This implies that at resonance the inductor/capacitor combination acts as a short circuit. The current flowing in the system is in phase with the source voltage. The power dissipated in the RLC circuit is equal to the power dissipated by the resistor.

Why do inductor and capacitor cancel each other at resonance?

At resonance in series RLC circuit, both inductive and capacitive reactance cancel each other and we know that in series circuit, the current flowing through all the elements is same, So the voltage across inductor and capacitor is equal in magnitude and opposite in direction and thereby they cancel each other.

What is RLC resonant frequency?

$\omega_0$  is called the resonance frequency of the RLC network. LC becomes equal to  $R$ . LC Therefore at the resonant frequency the impedance seen by the source is purely resistive. This implies that at resonance the inductor/capacitor combination acts as a short circuit. The current flowing in the system is in phase with the source voltage.
