## Overview

---

This article examines how five innovative technologies can transform abandoned or in-use coal mines into sustainable energy centres. From solar thermal to compressed air energy storage, these solutions offer a path to a more sustainable future while addressing the decline in coal production. Can underground coal mine space be used for energy storage?

In addition, the technology of using underground coal mine space for energy storage has become an effective means to promote the development of low-carbon clean energy due to its advantages of large space and low mining cost. However, there are still a few hazards and difficulties in its development and use procedures that need to be resolved.

What is coal underground thermal energy storage?

Coal underground thermal energy storage (CUTES) is a form of energy storage that makes extensive use of the underground highways in closed mines as a place to store energy and to offer heating and cooling in the winter and summer months, respectively.

Do coal mines need energy storage technologies?

Various energy storage technologies and risks in coal mine are analyzed. A significant percentage of renewable energy is connected to the grid but of the time-space imbalance of renewable energy, that raises the need for energy storage technologies.

How to promote coal mine energy storage?

(3) Provide financial incentives, such as subsidies, tax breaks and investment incentives, to attract investors to participate in coal mine energy storage projects. (4) Support technological innovation and R & D to promote the application and commercialization of new technologies in the field of coal mine energy storage.

Can coal mining space be used for electrochemical energy storage?

The use of coal mining space for electrochemical energy storage has not yet been commercialized, and four key problems still need to be broken through, namely, site safety evaluation of underground space for coal development, construction of electrochemical energy storage geological bodies.

How safe is underground electrochemical energy storage in coal mines?

Because underground electrochemical energy storage in coal mines needs to be equipped with a large number of batteries, it requires laying a large number of wires, which may lead to fires, so CUEES needs to be equipped with a complete and effective safety monitoring and protection system during operation to ensure safe operation. 6.2.
