## Overview

---

A theoretical computer scientist and his MIT colleagues are finding ways to reduce the energy used in computation—a change that could lead to laptops and mobile devices that are smaller and lighter, generate less heat, and last longer.

Does computing use a lot of energy?

Most developers of computer software and hardware focus on solving problems with maximum speed and minimum storage space. But energy use for computing is an increasing concern, according to Erik D. Demaine, professor of electrical engineering and computer science.

Why do we need thermal energy storage in data center?

Due to specific operation conditions, high security and high cooling load is required in data center. To achieve energy saving, cost saving and high security, novel cooling systems integrated with thermal energy storage (TES) technologies have been proposed.

What type of energy storage is used in data centers?

What is widely used in data centers is physical energy storage. Physical energy storage is further divided into sensible thermal energy storage (STES) and latent thermal energy storage (LTES). The commercial viability of LTES is limited by material characteristics and its initial cost, as opposed to STES that is mostly employed in data center.

Would a computer save energy?

In addition, computers would generate less heat, so calculations could run faster. Indeed, cutting energy use in half would halve heat output or double the processing speed. Over the past 70 years, the energy efficiency of computers has increased steadily.

What is thermal energy storage?

Among them, thermal energy storage is one of the most promising technologies to enhance the efficiency of energy sources (and increase the

energy efficiency of cooling system), which overcomes many mismatch between energy supply and demand in terms of time, temperature or site.

What is a good thermal storage material for a data center?

Concrete, metal, water and air are sensible thermal storage materials usually seen. Water is generally used as cold energy storage material in data centers, because of its low price, high specific heat capacity and no pollution or corrosion .
