## Overview

---

Lasers have progressed a long way from a point where they were famously regarded as a solution looking for a problem to the present day wherein there is nearly no field that has been left untouched by these e.

What is laser irradiation used for?

In addition to its traditional use, laser irradiation has found extended application in controlled manipulation of electrode materials for electrochemical energy storage and conversion, which are primarily enabled by the laser-driven rapid, selective, and programmable materials processing at low thermal budgets.

Can laser processing improve energy storage and conversion?

Specifically, the structural defects, heterostructures, and integrated electrode architectures, all of which have been actively pursued for energy storage and conversion in recent years, can be facilely, efficiently, and controllably modulated by laser processing.

How can laser irradiation be digitized?

Laser irradiation can be digitized by computer-aided design, permitting a programmable construction of patterned electrodes with arbitrary shapes and sizes (Figure 8G).<sup>107</sup> Pairing the adjacent two electrodes results in a device ready for capacitive energy harvest.

Can laser-enabled battery devices be fabricated through laser-mediated processes?

Because of the employment of different materials on anode and cathode, the fabrication of a rechargeable battery device through laser-mediated processes would be difficult. In contrast to the flourishing development of laser-enabled supercapacitor devices, laser-enabled battery devices have seldom been reported.

What are the disadvantages of laser-enabled materials for rechargeable batteries?

The major drawback of this technology is the low efficiency and high requirement of a sophisticated vacuum system. This deficiency could be Figure 10. Laser-Enabled Materials and Devices for Rechargeable Batteries (A and B) TEM (A) and SEM (B) images of the PLD-derived Fe<sub>2</sub>O<sub>3</sub> electrode.

Can diode pumped alkali vapor lasers improve thermal management?

However, the implementation of the critical technologies of beam combining at high power levels is still a complex process. Diode-pumped alkali vapor lasers (DPAL) seem to be promising as their high quantum efficiencies make thermal management easier.
