Disassembly diagram of old energy storage cylinder

Overview

How long should a gas cylinder be stored?

Longer term storage of gas cylinders (greater than two years) can lead to potential problems or incidents, increase the risks associated with cylinder movement, result in the degradation of cylinder condition, and add to the costs of compressed gas use and cylinder management.

Can a gas cylinder be stored outside?

Cylinders should not be exposed to continuous dampness and should not be stored near salt, corrosive chemicals or fumes. Rusting will damage cylinders and may cause valve protection caps to stick (see Compressed Gas Association [CGA] Pamphlet P-1-1965). If placed in outdoor storage, cylinders often begin to degrade after two to three years.

Can you open a gas cylinder if it is dormant?

Opening the valve to assess the gas quantity inside the cylinder is not recommended on cylinders dormant more than 15 years. If necessary, use extreme care when opening the valve on cylinders between 10 and 15 years old. Do not open a cylinder if you are unsure of its contents. If the valve appears to be damaged, do not open it.

Are cylinders destined for disposal a hazardous waste?

The contents of cylinders destined for disposal are considered solid waste (under the Resource Conservation and Recovery Act [RCRA] regulations) and must be characterized to determine if RCRA hazardous waste management regulations apply. Disposal as a hazardous waste can be very costly.

What are compressed gas cylinders used for?

Compressed gas cylinders are used across the U.S. Department of Energy (DOE) Complex in many applications including equipment maintenance, repair, machine shops, food services, and in experiments at research facilities.

Types of gases involved include pure gases, standard mixtures, and special or calibration mixtures.

What happens if you rust a gas cylinder?

Rusting will damage cylinders and may cause valve protection caps to stick (see Compressed Gas Association [CGA] Pamphlet P-1-1965). If placed in outdoor storage, cylinders often begin to degrade after two to three years. Legitimate reasons for keeping cylinders past two years may include: Advance ordering due to budget constraints.
