## Overview

What is the peak cutting efficiency of energy storage?

Correspondingly, the peak cutting efficiency of energy storage is the highest, reaching about 90 %. The peak cutting efficiency of newly added PV installations and DR is insufficient, which is about 50 %. (3) The analysis shows that PV installations are more effective in the day while USDR is more effective at night.

Can energy storage reduce grid demand?

Moreover, the integrated use of PV and energy storage systems can reduce the prediction of grid demand. ES can smooth the demand curve and improve system reliability by storing excess renewable energy during load valleys and releasing the stored energy during load peaks .

Do PV systems reduce peak load?

Jurasz and Campana demonstrated the economic benefits of using PV systems to reduce peak load. Moreover, the integrated use of PV and energy storage systems can reduce the prediction of grid demand.

How fast can a laser cut a lithium metal substrate?

Moreover, it was recently demonstrated that laser pulses in the nanosecond range enable the separation of lithium metal substrates at exceptional cutting speeds of more than  $5 \text{ m s}^{-1}$  ( Kriegler ., 2022 ).

Do es power stations reduce peak load without waste?

ES can precisely match the peak load reduction needs. Thus, deploying ES power stations is the most flexible and effective load peak regulation measure, which reduces the peak load without waste. However, the cost of constructing ES power stations is very high.

Can peak load optimization reduce the total cost of new PV installations?

This study proposed the peak load optimization model to minimize the total cost by combining newly added PV installations, USDR, and ES. The total cost is equal to the sum of the costs of the three measures, ignoring the system consumption costs of the new PV.
