Battery Energy Storage Systems, or BESS, help stabilize electrical grids by providing steady power flow despite fluctuations from inconsistent generation of renewable energy sources and other disruptions. While BESS technology is designed to bolster grid reliability, lithium battery fires at some.

The International Renewable Energy Agency predicts that with current national policies, targets and energy plans, global renewable energy shares are expected to reach 36% and 3400 GWh of stationary energy storage by 2050. However, IRENA Energy Transformation Scenario forecasts that these targets.

Each component of the electric system presents risks—from transformers and gas lines to power plants and transmission lines—and their safe operation is critical to provide the electricity that keeps our lights on, our refrigerators running, our homes air conditioned and heated, and our businesses.

Amidst the background of accelerated global energy transition, the safety risk of lithium-ion battery energy storage systems, especially the fire hazard, has become a key bottleneck hindering their large-scale application, and there is an urgent need to build a systematic prevention and control.

EPA has issued what it called the first comprehensive federal safety guidance for battery energy storage systems (BESS), outlining best practices for siting, installation, operation and emergency response. The guidelines stress community preparedness and responder safety, including zoning compliance.
