Many Californians will install batteries and other energy storage technologies in their homes and workplaces in the coming months. Best practices can make installation of energy storage safe. The CPUC offers links to the most relevant best practices and standards from a wide range of sources on.

acting the timely deployment of safe energy storage systems (ESS). The timely deployment of safe ESS is affected by the ability of relevant parties to document and validate that a proposed ESS installation will comply with safety criteria as represented by codes, standards, and regulations (CSR). A.

Codes, standards, and regulations (CSR) governing the design, construction, installation, commissioning, and operation of the built environment are intended to protect the public health, safety, and welfare. While these documents change over time to address new technology and new safety challenges.

Challenges for any large energy storage system installation, use and maintenance include training in the area of battery fire safety which includes the need to understand basic battery chemistry, safety limits, maintenance, off-nominal behavior, fire and smoke characteristics, fire fighting.

One of three key components of that initiative involves codes, standards and regulations (CSR) impacting the timely deployment of safe energy storage systems (ESS). A CSR working group has been monitoring the development of standards and model codes and providing input as appropriate to those.

Note: This checklist serves as a general guide and should be customized based on specific project requirements and applicable regulations. Within the Engineering industry, the Battery Energy Storage Systems safety checklist is an important recurring process. This template provides a good starting. Do

energy storage systems need a CSR?

Until existing model codes and standards are updated or new ones developed and then adopted, one seeking to deploy energy storage technologies or needing to verify an installation's safety may be challenged in applying current CSRs to an energy storage system (ESS).

What is a safety standard for stationary batteries?

Safety standard for stationary batteries for energy storage applications, non-chemistry specific and includes electrochemical capacitor systems or hybrid electrochemical capacitor and battery systems. Includes requirements for unique technologies such as flow batteries and sodium beta (i.e., sodium sulfur and sodium nickel chloride).

What if energy storage system and component standards are not identified?

Energy Storage System and Component Standards 2. If relevant testing standards are not identified, it is possible they are under development by an SDO or by a third-party testing entity that plans to use them to conduct tests until a formal standard has been developed and approved by an SDO.

What is the energy storage safety strategic plan?

Under the Energy Storage Safety Strategic Plan, developed with the support of the U.S. Department of Energy (DOE) Office of Electricity Delivery and Energy Reliability Energy Storage Program by Pacific Northwest Laboratory and Sandia National Laboratories, an Energy Storage Safety initiative has been underway since July 2015.

Do electric energy storage systems need to be tested?

It is recognized that electric energy storage equipment or systems can be a single device providing all required functions or an assembly of components, each having limited functions. Components having limited functions shall be tested for those functions in accordance with this standard.

Can Li-ion battery chemistry be used for stationary grid energy storage?

Apart from Li-ion battery chemistry, there are several potential chemistries that can be used for stationary grid energy storage applications. A discussion on the chemistry and potential risks will be provided.
