What is a GIS substation?

The main function of a GIS substation is to switch, separate, transform, measure and distribute electrical energy in power systems. The main feature of a GIS device is the use of SF<sub>6</sub>, an inert gas with exceptional insulation properties, and chemical and thermal stability.

What is the difference between a GIS Unit and a switchgear unit?

The main feature of a GIS device is the use of SF<sub>6</sub>, an inert gas with exceptional insulation properties, and chemical and thermal stability. By comparison, a GIS unit only requires centimeters for effective insulation, while an air-insulated switchgear unit would need meters to perform the same function.

Does GE offer gas-insulated substations?

GE provides a full range of SF<sub>6</sub> Gas-Insulated Substations (GIS) as well as SF<sub>6</sub>-free g<sub>3</sub> GIS at 145 kV and 420 kV for utilities and industries worldwide. GE's Gas-Insulated Lines (GIL) Dual Gas, available with SF<sub>6</sub> or SF<sub>6</sub>-free with g<sub>3</sub> gas, meet the challenges of electrical networks up to 800 kV.

What is G<sub>3</sub> GIS?

g<sub>3</sub> is GE's environmentally friendly alternative to SF<sub>6</sub> for high voltage applications above 66 kV. GE provides a full range of SF<sub>6</sub> Gas-Insulated Substations (GIS) as well as SF<sub>6</sub>-free g<sub>3</sub> GIS at 145 kV and 420 kV for utilities and industries worldwide.
