# Homemade energy storage spring

## Overview

What is spring based energy storage?

Spring-based energy storage is common in toys: jack-in-the-box, snake-in-a-can. I've heard of the opposite system - a concrete block on springs, say, a sidewalk paver in a busy city. As people walk on this block, it compresses the springs underneath it and - something-something, kinetic energy is stored for later use.

How do you store energy?

To store energy, pull up the plate. To release energy, release the plate. Springs store energy with the square of the displacement. What part of this won't work?

EDIT: I was wrong about the square of extension behavior, the actual behavior is linear+non-linear over a quite short distance as described here.

Can you build a 10 kW free energy generator using a flywheel spring machine?

Building a 10 KW free energy generator using a flywheel spring machine is a complex but rewarding project. With the right materials, careful assembly, and proper maintenance, you can harness the power of free energy and reduce your reliance on traditional energy sources. Frequently Asked Questions What is a flywheel spring machine?

.

How much energy does a spring system take up?

For the average U.S. household, this would last about 11 hours. It's energy density is about 100 kWh per m<sup>3</sup>. To get a similar amount of energy from a system of springs, it would need to be 45 m<sup>3</sup>, or about 350 times larger. Assuming a ceiling height of 2.5 m, this would take up about 18 m<sup>2</sup> -- about the size of a single car garage.

How do you store energy in a concrete plate?

Imagine a concrete plate resting on hundreds of firmly attached sturdy springs, and a couple of electric winches attached to the top. To store energy, pull up the plate. To release energy, release the plate. Springs store energy with the square of the displacement. What part of this won't work?

.

Can a spring system convert electric energy into potential energy?

Great answer! It's also important to point out that converting electric energy into the potential energy of a spring system would involve much more losses than storing that same energy into the electro-chemical energy of a battery. The same problem regarding the loss will persist when you use the energy stored in the springs.
