Inspection issues of water storage power plants

Overview

Do hydroelectric power plants need underwater inspection and maintenance services?

Hydroelectric power plant environments, normally associated with turbid waters, have complex inspection needs and frequent requests for underwater inspection and maintenance services.

How pumped storage projects affect dam and Public Safety?

Pumping is the principal feature that sets pumped storage projects apart from conventional hydro projects and overtopping of a project reservoir is the principal failure mode that could impact dam and public safety. Therefore, control and management of water levels is critical to assuring dam and public safety.

How often should hydroelectric dams and power plants be inspected in Brazil?

In Brazil there is a legal requirement to inspect all hydroelectric dams and power plants (HPP) every five to ten years, but the methods to be employed for such inspection are not well-defined. Most of the work is currently done by autonomous scuba divers using visual and conventional direct methods.

Do pumped-storage power plants resist IWP?

However, SSCs in pumped-storage power plants actually do not resist IWP fully together with the surrounding concrete. This is because of the special embedment conditions for SSCs in pumped-storage power plants, under which a SSC is pressurized to a certain temporary pressure with water while encasement concrete is placed.

What considerations should be considered in a pumped storage plant?

In addition to the design basis considerations for instrumentation that is discussed in section 1 of this document, the following additional considerations should be considered regarding the design, testing, operation

and maintenance of level instrumentation in a pumped storage plant. Field instrumentation is essential for operational safety.

What is the purpose of a water conveyance inspection?

The purpose of this document is to provide guidance for the inspection, monitoring, and evaluation of the safety of water conveyance structures at hydropower projects. Failure of water conveyances can lead to loss of life, property damage, and environmental concerns, in addition to the loss of the intended function of the project.
