# Mountain gravity battery energy storage system

## Overview

---

What is mountain gravity based energy storage?

A new energy storage solution based on mountain gravity is found particularly for grids smaller than 20 MW. MGES is a solution for seasonal storage where there is no water for pumped-storage solutions. We show the world potential for MGES using a GIS based tool.

Could mountains be used to build a battery for long-term energy storage?

A team of European scientists proposes using mountains to build a new type of battery for long-term energy storage. The intermittent nature of energy sources such as solar and wind has made it difficult to incorporate them into grids, which require a steady power supply.

Is mountain gravitation energy storage a viable alternative to long-term energy storage?

**Conclusion** This paper concludes that mountain gravitation energy storage could be a viable alternative to long-term energy storage, particularly, in isolated micro-grids or small islands demanding storage capacities lower than 20 MW.

Can batteries provide long-term energy storage?

In the near future, batteries can provide short-term storage solutions and pumped-hydro storage can provide long-term energy storage with large generation capacities. However, none of these technologies can provide long-term energy storage in grids with small demand.

Why is MGEs a good choice for energy storage?

As it can be seen the MGES plant operation focuses on storing energy for the long-term and the batteries are used to store energy for the short-term. This is convenient because the installed capacity of MGES (short-term storage) is high, however the costs for long-term energy storage is low.

How much does it cost to store energy with MGEs?

This paper shows that the cost of storing energy with MGES will vary between 1 and 2 million \$/MW of installed capacity and levelized cost of 50–100 \$/MWh. The higher the height difference between the lower and upper storage sites, the lower the cost of the project.
