Overview

Power Reserve refers to the running time of a fully wound mechanical watch (manual-wind or automatic). For example, if you fully wind your watch and place it on your dresser, how long before it stops running and needs to be wound again - that is the power reserve.

If a watch has a power reserve longer than 62 hours, you can take it off on Friday night after work and put it on again on Monday morning and it will still be running. What is power reserve in a watch?

The amount of stored power is measured in hours or days and is called the watch's power reserve. Most watches have one barrel, but some watchmakers

How long should a mainspring power reserve be?

Until recently, the most common length of power reserve was around ~38 hours (an ETA 2824-2 for example) or 46 hours (an ETA/Unitas 6497-1). With advances in materials and design of mainsprings and mainspring barrels, it has become a trend to increase the power reserve as much as possible.
