MXenes, two-dimensional compounds, owing to their similarity to graphene, were largely attracted in the electronic field in the form of energy storage and conversion. MXenes display maximum electrical conductivity, functionalized surface areas, and high mechanical stability. The unique morphology.

MXenes, two-dimensional compounds, owing to their similarity to graphene, were largely attracted in the electronic field in the form of energy storage and conversion. MXenes display maximum electrical conductivity, functionalized surface areas, and high mechanical stability. The unique morphology.

MXenes, a class of two-dimensional transition metal carbides and nitrides, emerged as a promising material for next-generation energy storage and corresponding applications due to their unique combination of high electrical conductivity, tunable surface chemistry, and lamellar structure. This.

MXenes are highly versatile, generating substantial interest in the fields of sensors, energy storage, environmental science, catalysis, biomedical applications, and electronics. This review is summarized in terms of MXene's structural composition, synthesis, and applications. We also focus most on. Can MXene fibers be used in flexible energy storage?

With a composition containing 90 wt% of MXene, the resulting fibers exhibited a remarkable conductivity of  $2.9 \times 10^4 \text{ S m}^{-1}$ , accompanied by a specific capacitance of  $586.4 \text{ F cm}^{-3}$ . This work pioneered the research on using MXene fibers in the field of flexible energy storage.

How does MXene reactivity affect the performance of energy storage materials?

The high reactivity of exposed MXene metal atoms promotes oxidation of the surface and edges, which reduces the conductivity and affects the performance of MXene-based materials in energy storage applications.

What is MXene ion storage mechanism?

The mechanism, coupled with the high electrical conductivity, equips MXene electrodes with a high-rate energy storage capability [62, 69]. The specific rate ability varies with the MXene type and electrolyte choice.
