Energy storage and conversion are vital for addressing global energy challenges, particularly the demand for clean and sustainable energy. Functional organic materials are gaining interest as efficient candidates for these systems due to their abundant resources, tunability, low cost, and. How will organic-based energy storage materials impact non-conventional applications?

The application of organic-based energy storage materials will most likely impact non-conventional applications first, where their unique properties, such as ultra-fast charging, stretchability, processability in solution, etc., can give them the edge over inorganic materials.

Can heterogeneous redox-active organic materials be used for energy storage and electrocatalysis?

With a wide range of techniques available to characterize charge/discharge processes, heterogeneous redox-active organic materials can be thoroughly investigated for their viability for energy storage and/or heterogeneous electrocatalysis.

Are organic materials the future of energy storage & conversion?

As research and development continue to advance in this field, organic materials are expected to play an increasingly pivotal role in shaping the future of technology and innovation. To fully harness the potential of

functional organic materials in energy storage and conversion, future research efforts should prioritize several key areas.

Can functional organic materials be used for energy storage and conversion?

The review of functional organic materials for energy storage and conversion has revealed several key findings and insights that underscore their significant potential in advancing energy technologies. These materials have demonstrated remarkable promise in meeting the increasing demand for efficient and sustainable energy solutions.

Can redox-active organic molecules improve energy storage performance?

Researchers are actively developing novel redox-active organic molecules with customized structures and functionalities to enhance the performance of energy storage systems (Mauger et al. 2019).

Why is reorganization energy lower in organic or inorganic materials?

Since the energy is stored in electron rearrangements of delocalized systems rather than changes in a crystal structure, the reorganization energy of the respective electron-transfer reaction is usually much lower in organic than in inorganic materials. More importantly, the charges in the respective materials need to be balanced by ions.
