Paper industry energy storage project

Overview

Are paper mills energy efficient?

Globally, demand and production of pulp and paper is expected to increase significantly by 2050, thus driving up the associated absolute energy use and greenhouse gas emissions. The need for an improvement in the energy performance of paper mills is a longstanding issue, and dates back to Thompson et al. studies.

Can drying pulp and paper reduce energy consumption?

The Confederation of the European Paper Industries (CEPI), and the European Heat-Pump Association (EHPA) conclude that this will not only potentially reduce emissions through fuel substitution but can also lead to a 50% reduction in energy demand for drying pulp and paper (drying accounts for 70% of the energy use in the sector).

Why do paper mills need a heat recovery system?

This means they can be integrated into paper mills for drying, boiling, and bleaching processes while remaining highly efficient by recuperating waste heat and raising its temperature.

Is cogeneration a cost-effective strategy for paper mills?

Since heat is required in the process of drying the mid-products while electricity is contemporarily employed to operate the machines, cogeneration systems have been widely adopted globally as an efficient and cost-effective strategy to meet paper mills energy demand.

What is a seasonal storage system for a paper mill?

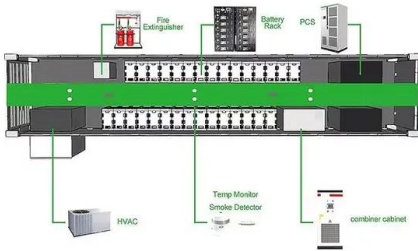

Storage system It is essential to consider a seasonal storage system, capable of absorbing the fluctuations in renewable production and ensuring the continuous operation of the paper mill throughout the year. All the hydrogen consumed by the CHP has to be produced on-site and no external supply

system has been envisaged.

Can cogeneration save energy in a paper mill?

A feasibility study, described in Ref. , has been conducted to evaluate the energy saving potential and economic benefits of various cogeneration options in a paper mill.
