Principle of mine thermal energy storage

Overview

What are underground energy storage and geothermal applications?

Underground energy storage and geothermal applications are applicable to closed underground mines. Usually, UPHES and geothermal applications are proposed at closed coal mines, and CAES plants also are analyzed in abandoned salt mines. Geothermal power plants require flooded mines, which generally have closed more than 5 years ago.

Should closed mines be used for energy storage and geothermal energy plants?

The use of closed mines for the implementation of underground energy storage plants and geothermal energy plants has important environment benefits, but usually higher operation and maintenance costs (O&M) compared to conventional systems.

Why is thermal energy storage important?

Based on this strategy, thermal energy storage systems represent an important foundation for the increased use of renewable energies. The transition to a sustainable energy supply requires the provision of large electrical as well as thermal storage capacities.

How can abandoned mine facilities be used to generate energy?

Finally, a CAES plant could be established, using the upper mine galleries for underground air storage; the fact that Lieres is a “dry mine” is ideal for this type of system. Thus, the abandoned mine facilities are efficiently used to generate both electrical and thermal renewable energy. Fig. 5.

Can abandoned mines be used for energy storage?

Closed mines can be used for the implementation of plants of energy generation with low environmental impact. This paper explores the use of abandoned mines for Underground Pumped Hydroelectric Energy Storage

(UPHES), Compressed Air Energy Storage (CAES) plants and geothermal applications.

Can mine water be used as a geothermal resource?

The utilization of mine water as a geothermal resource and/or as a thermal energy storage has the potential to play a key role to reach the ambitious climate goals set by the COP21.
