Do parking spots affect peak shaving and valley filling of power consumption profile?

Moreover, the results of Scenario C confirm the observation in Scenario B that the peak shaving and valley filling of the power consumption profile improves as the number of the considered parking spots (and by extension, of the simultaneously available EVs) gradually increases.

Does constant power control improve peak shaving and valley filling?

Finally, taking the actual load data of a certain area as an example, the advantages and disadvantages of this strategy and the constant power control strategy are compared through simulation, and it is verified that this strategy has a better effect of peak shaving and valley filling. Conferences > 2021 11th International Conference.

Can load peak shaving and valley filling reduce PVD?

The function of load peak shaving and valley filling is achieved, thus ensuring the safe and orderly operation of the rural power grid. The feasibility of the strategy is verified through simulation results on multiple scenarios, for the decreased PVD of 44.03%, 24.3%, and 33.4% in Scenario 1-3.

How is peak-shaving and valley-filling calculated?

First, according to the load curve in the dispatch day, the baseline of peak-shaving and valley-filling during peak-shaving and valley filling is calculated under the constraint conditions of peak-valley difference improvement target value, grid load, battery power, battery capacity, etc.
