The revenue potential of energy storage is often undervalued. Investors could adjust their evaluation approach to get a true estimate—improving profitability and supporting sustainability goals. As the global build-out of renewable energy sources continues at pace, grids are seeing unprecedented.

Net present value (NPV) is the current worth of a future sum of money or stream of cash flows given a specified rate of return. It is a great tool to analyse the profitability of an investment independent of different lifetimes and account for inflation and degradation - two of the biggest impacts.

2025's energy storage market is like a Tesla battery fire - hot, unpredictable, and full of potential. The global energy storage market is projected to grow from \$44 billion in 2023 to \$86 billion by 2030 [3]. But here's the kicker: not all power storage investments are created equal. Forget. Is energy storage a profitable business model?

Although academic analysis finds that business models for energy storage are largely unprofitable, annual deployment of storage capacity is globally on the rise (IEA, 2020). One reason may be generous subsidy support and non-financial drivers like a first-mover advantage (Wood Mackenzie, 2019).
