Overview

What is a pumped-storage power plant?

A pumped-storage power plant is a reversible hydroelectric facility where water is pumped upwards into a reservoir from a water source below it. It stores water in an elevated reservoir and then releases it to generate electricity when needed, using turbines in the same way as conventional hydroelectric plants.

What is a pumped storage hydroelectric power plant?

A pumped storage hydroelectric power plant stores electricity by pumping water during off-peak times. In such a plant, the stored water can be utilized to generate electricity. The hydroelectric power plant can store electricity in Megawatts (MW) or even Gigawatts (GW). The potential and kinetic energy of the stored water is then converted into electric energy.

Can a pumped storage power station help a solar power plant?

The same can be applied to solar generation: the pumped storage power station can contribute to constant electricity production at night time when there is no sunshine to run a solar power plant. The flexibility extends not just to the turbine and tank sizes, but also to the depth the system is installed at.

How does a pumped storage power plant turbine work?

In the new design, the pumped storage power plant turbine will be integrated with a storage tank located on the seabed at a depth of around 400-800 m. The way it works is: the turbine is equipped with a valve, and whenever the valve is opened water flows in and turns the turbine.
