Overview

What is shared energy storage?

Shared energy storage is generally applied in the supply, network, and demand sides of power systems. The shared energy storage at the supply side is mainly utilized for renewable energy consumption (Zhang et al., 2021). The proportion of renewable energy is greatly increasing due to the continuous promotion of "carbon peaking and neutrality".

How to create a shared energy storage community?

Community setup The first step to have shared energy storage is to form communities which are built by using the k -means approach. The geographical locations (longitude and latitude) are used to cluster the households. In this case, $K = 3$ is used to form three communities due to the distance limitation of CES and the road intersection.

Should community energy storage be used instead of private energy storage?

Computational results are presented on two real use cases in the cities of Ennis, Ireland and Waterloo, Canada, to show the advantage of using community energy storage as opposed to private energy storage and to evaluate the cost savings which can facilitate future deployment of community energy storage.

What is a shared energy storage mode?

The shared energy storage mode can attract more capital to actively invest in the energy storage industry, accelerate the development of energy storage scale and maximize the efficiency of energy storage utilization. Transactive energy (TE) (Yang et al., 2020): it is the application of sharing economy in the field of the electricity market.

What is community energy storage?
