Storage modulus and dispersibility

Overview

Storage Modulus (E' or G'): The storage modulus is a measure of the stored energy in a material during deformation, reflecting its elastic or 'solid-like' behavior. It indicates how much energy a material can store when subjected to a deforming force and subsequently release when the force is.

Storage Modulus (E' or G'): The storage modulus is a measure of the stored energy in a material during deformation, reflecting its elastic or 'solid-like' behavior. It indicates how much energy a material can store when subjected to a deforming force and subsequently release when the force is.

The slope of the loading curve, analogous to Young's modulus in a tensile testing experiment, is called the storage modulus, E' . The storage modulus is a measure of how much energy must be put into the sample in order to distort it. The difference between the loading and unloading curves is called.
