Sweden hengqin thermal energy storage

Overview

What is thermal energy storage in Sweden?

In Sweden, Thermal Energy Storage consists primarily of Tank TES for short term storage, and Aquifer and Borehole TES for long term storage. In Sweden, TTES consist of large hot water accumulator tanks used to provide short term storage of hot water for district heating. Short term is usually regarded as 6-10 hours of total demand.

Should we study the Swedish energy system at national scale?

Hitherto studies have predominantly focused on electricity sector. Nevertheless, the targets for 2045 necessitates studying the Swedish energy system at national scale in the context of sector coupling & storage.

What is the future of the Swedish energy system?

Table 1. Summary of literature review. In case of the Swedish energy system, there are uncertainties surrounding the future of nuclear power plants, the anticipated increase in wind and solar PV installations, electrification trends, and the role of hydrogen in the steel industry [34, 35].

Does Sweden still have a thermal power plant?

Although Sweden has some remaining electricity-only thermal power plants (powered by biofuels, natural gas and coal), these are increasingly being phased out in favour of CHP connected with district heating. Within CHP plants, biofuels and municipal waste are consumed, with some fossil fuels (gas and coal) used in reserve.

What is thermal energy storage?

Research Problem: A key topic for the group is thermal energy storage (TES), which is one method to address the challenge of integrating the intermittent generation of renewable energy into the common electricity grid.

Does Sweden have a heating system?

Solar Photovoltaic (PV): Solar PV provides a negligible (less than 0.1%) of the electricity supply in Sweden (Swedish Energy Agency, 2010). District heating supplies approximately 50% of the heating demand in Sweden (Ericsson, 2009). Boilers: Most modern Swedish district heating boilers are capable of combusting a variety of fuels.
