## Overview

What causes a battery enclosure to explode?

The large explosion incidents, in which battery system enclosures are damaged, are due to the deflagration of accumulated flammable gases generated during cell thermal runaways within one or more modules. Smaller explosions are often due to energetic arc flashes within modules or rack electrical protection enclosures.

What causes large-scale lithium-ion energy storage battery fires?

Conclusions Several large-scale lithium-ion energy storage battery fire incidents have involved explosions. The large explosion incidents, in which battery system enclosures are damaged, are due to the deflagration of accumulated flammable gases generated during cell thermal runaways within one or more modules.

Why are batteries prone to fires & explosions?

Some of these batteries have experienced troubling fires and explosions. There have been two types of explosions; flammable gas explosions due to gases generated in battery thermal runaways, and electrical arc explosions leading to structural failure of battery electrical enclosures.

Why are explosion hazards a concern for ESS batteries?

For grid-scale and residential applications of ESS, explosion hazards are a significant concern due to the propensity of lithium-ion batteries to undergo thermal runaway, which causes a release of flammable gases composed of hydrogen, hydrocarbons (e.g. methane, ethylene, etc.), carbon monoxide, and carbon dioxide.

What causes a thermal runaway gas explosion?

The thermal runaway gas explosion scenarios, which can be initiated by various electrical faults, can be either prompt ignitions soon after a large

flammable gas mixture is formed, or delayed ignitions associated with late entry of air and/or loss of gaseous fire suppression agent.

What happened at McMicken energy storage unit?

This incident occurred at the Arizona Public Service (APS, 2019) McMicken Energy Storage Unit facility in Surprise, Arizona, 28 miles northwest of Phoenix. As shown in Fig. 3, the facility is adjacent to an APS substation. It is a 2 MW, 2 MWh facility with 27 racks, each containing 392 Li-ion Nickel-Manganese-Cobalt pouch cells (DNV GL, 2020).
